

Security configuration with third-party servlet filters

I don't mean to pick on [New Relic](#) but if you are running a fledgling little start-up with some traffic, commercial monitoring of your servers can cost an arm and leg. As always, there's an open source alternative: [Javamelody](#). Since Javamelody is implemented as a single servlet filter, I figured it was a good sample for showcasing integration of third-party libraries into your Tapestry application secured with Tapestry-security module. See the examples section in our [tapestry-security guide](#) for more information!
