

# Maven 2.0 Use Cases

Trying to get a large set of use cases that we can use to help drive development in the right direction. I would like to collect some here and then post them to the wiki as examples users can template to express what their use cases are. So my first example is something I chatted about with Aslak this morning.

So they are brief and possibly naive but a huge collection of these would help I think:

- Easy project setup
- Encapsulated reporting
- Multi-modules application with consolidated build
- Platform specific dependencies
- Secondary artifact types
- specification dependencies
- Summary of Artifact Use Cases
- Support for branched codebases
- Support for JDK specific dependencies
- Support for other languages than java
