## Declaratively Securing Data Instances with ERBAC

Unknown macro: 'html'

Security systems have traditionally had a high level of support for Role-Based Access Control (RBAC) but typically fail at providing more than programmatic checks for instance-level access control. Come and see how Entity-Relationship Based Access Control (ERBAC) allows you to declaratively secure instances of data by using their association with the currently executing subject. Kalle Korhonen will be presenting an overview of several add-on modules he's built on top of Apache Shiro to provide comprehensive security framework for modern web applications using Apache Tapestry 5 and JPA.

(Presented at [Apache Shiro Meetup on June 6th, 2012](#))
