

How to Browse a Subversion Repository via ViewCVS

All Subversion repositories created on Codehaus can be viewed via the web using the ViewCVS interface. The only requirement is that the apache user is part of the Unix group that owns the repository as ViewCVS requires read-write access to the repository. No configuration changes are required to the ViewCVS configuration file (`/usr/local/viewcvs-1.0-dev/viewcvs.conf`) as long as the appropriate symlink exists in `/svnroot`. The administrator that created the repository most likely has already done this on your behalf.

Assuming the user wants to view the `FOO` repository via ViewCVS, point your browser to <http://svn.FOO.codehaus.org>. All projects should be able to access their Subversion repositories in this manner.
