

Boo Parser

Boo uses the [ANTLR](#) parser generator to create the parser for boo source code.

The parsing rules are defined in the [boo.g](#) grammar file included with the boo source distribution.

Here is a [diagram of the boo syntax](#), generated automatically from the boo.g file via the syndiag tool.

Future Plans for using ANTLR with boo

Right now boo uses ANTLR's C# code generator and runtime library to generate and run the boo parser. We also have a boo code generator for ANTLR which we will switch to in the future.
