

tapestry-security 0.4.3 released!

I swear, I thought tapestry-security already implemented anything you need for security. But turns out I was wrong. So, we quickly put together another, even more awesome release of tapestry-security for Apache Tapestry 5 from tynamo.org, with the following enhancements in the newly baked 0.4.3:

Bug

- [\[TYNAMO-124\]](#) - Context path duplicated when redirecting to saved request
- [\[TYNAMO-133\]](#) - ShiroHttpServletRequest isn't used if there's no chain associated with the request

Improvement

- [\[TYNAMO-121\]](#) - Ability to plug into ExceptionPage for the same exception type
- [\[TYNAMO-127\]](#) - Make SubjectFactory and RememberMeManager their own services for better flexibility

New Feature

- [\[TYNAMO-128\]](#) - Make Authenticator its own service to allow registering authenticationlisteners

Check out the [tapestry-security guide](#) for more information and enjoy!

Oh and btw, we had also previously released but hadn't announced a bug-fix release 0.1.2 for the exceptionpage module, that tapestry-security uses for exception handling. The lone issue was:

Bug

- [\[TYNAMO-126\]](#) - Exceptionpage doesn't work for page contributions
