

# SQLExecutor

Data can be read from and written/routed to a database using the <db:executor> configuration from the <http://www.milyn.org/xsd/smooks/db-routing-1.1.xsd> namespace. The <db:executor> requires a Datasource to be configured. This is done via the <ds:direct> and <ds:JNDI> configurations from the <http://www.milyn.org/xsd/smooks/datasource-1.1.xsd> configuration namespace.

See the "Routing to a Database" section.
