

# GPars 0.11 is ready

Here's some good news for all the developers crafting concurrent code - GPars 0.11 has just been released. Get it fresh at your local Groovy store or go directly to the [GPars download site](#). A lot has changed since the previous release. The most notable additions and changes in 0.11 include:

- Great actor speed-up, so now you don't have to shop elsewhere for fast actors
- Full-blown dataflow implementation with selectors, prioritySelectors, composable tasks, point-to-point and publish-subscribe channels and more
- [Java API](#) allowing you to take GPars with you wherever you go

You can check out more details at [at the What's new section of the User Guide](#) or read [full release notes](#).

Concurrency has never been easier. Get GPars now, have fun and let us know what you think.

*The GPars Team*
