

# Registration of artifacts

## Overview

In order to show a list of all artifacts in your project, we need to either force you to use a cumbersome web upload system; or scan your project area for new artifacts.

We have decided on the latter; regularly scanning your project area for new downloadable artifacts.

## Triggering a scan

If you've uploaded a bunch of artifacts, or have an indeterminate number of changes in your site, you can trigger a full scan of your repository. New artifacts will be assigned to the [Unknown Version](#), and any missing artifacts will be detected.

## Registering an artifact

You can also use the [Remote API](#) to register an artifact immediately.

You will also want to review the process for [Classification of Artifacts](#).
