

# Translating Packages in PacksPanel

Assuming a package is defined in this way:

## install.xml

```
<packs>
  <pack name="Core Files" required="yes" id="core.package">
    <description>The core files required for this application</description>
    ...
  </pack>
</packs>
```

the according name and description can be translated in the installer in the following way:

First, define a package translation file per language, for example german:

## packsLang.xml\_deu

```
<langpack>
  <str id="core.package" txt="Anwendungs-Kern" />
  <str id="core.package.description" txt="Unbedingt notwendige Dateien für das
  Betreiben dieser Anwendung" />
</langpack>
```

and add them as packsLang.xml\_<LANGUAGE\_CODE> to the installation descriptor:

## Add package translation resources to install.xml

```
<resources>
  <res id="packsLang.xml_eng" src="i18n/packsLang.xml_eng" />
  <res id="packsLang.xml_deu" src="i18n/packsLang.xml_deu" />
</resources>
```
