

CheckedHelloPanel

The CheckedHelloPanel acts like the [HelloPanel](#), displaying a welcome message including project name, the version, the URL as well as the authors.

For Windows, it also scans the Windows registry for an entry that determines whether the product is already installed. For this purpose, the elements `<appname>` and `<appversion>` in the `<info>` element of the installation definition file, in the for

`$appName $appVersion` (divided by a space character).

If the product was previously installed installed, a dialog will be shown which asks whether to install a second version of the product or not.

If you use this panel do not forget to add the COIOSHelper registry feature into your installation, see [Windows Registry Access](#) for more details.

See also [RegistryInstallerListener / RegistryUninstallerListener](#) for getting an idea how this information in the registry can be created during an IzPack installation and deleted during uninstalling.
