

Reusable Resources

Resources Definition

Resources are currently only classpath resources, however the concept of a resource set and the processing model for resources applies to other types of resources, including:

- webapp resources
- plugin input files (eg MDO files for maven.mdo)

We should evaluate whether we can find better ways to specify resources, such as uniquely identified resource sets, and utilise them from plugin configuration. The resource sets may or may not belong in the build section any more.
