

# ChmodCompilerListener

This listener does provide the information needed by the [ChmodInstallerListener](#). During compilation of the installer it reads the <additionaldata> from the xml and writes it into the installer.

For this purpose, you must apply the nested <additionaldata> element to a [pack's <file>](#), [<fileset>](#) or [<singlefile>](#).

Attribute	Description	Value range
key	An action key to apply	permission.dir   permission.file
value	A value to the above action key for specifying how to apply the particular action.	Integer If the value begins with "0", it is interpreted as an octal number, otherwise as a decimal number representing the chmod-compatible permission on the appropriate files when the listener is executing during the compilation of the package.
