

# Input Simulation

FEST-Swing uses an [AWT Robot](#) to generate user input. The `AWT Robot` is capable of generating native events, providing the most accurate simulation of an actual user. The `Robot` can move the mouse pointer and press keys just like a user would.

The following pages explain input simulation in more detail:

- [Editing JTable Cells](#)
- [Simulating Drag 'n Drop](#)
- [Simulating Keyboard Input](#)
- [Simulating Mouse Input](#)
