

Building

AcitveSOAP uses [Maven](#) as its build tool. If you don't fancy using Maven you can use your IDE directly or [Download](#) a distribution or JAR.

We have tested the build with Maven 1.0 and it works fine. Later versions of Maven may vary - if you hit problems on other versions please talk to us on the [mail lists](#).

Getting started

- Download and [install Maven](#).
- Get the latest code [from CVS](#)
- Build the code with the following command

```
maven
```

Using an IDE

If you prefer to use an IDE then you can autogenerate the IDE's project files using maven plugins. e.g.

```
maven eclipse
```

or

```
maven idea
```

etc.

Please refer to the [plugin reference](#) for more details on using them.
